Univariate Optimization Problems

$$\frac{g(x) - 109x}{1+x}$$

$$g(x) = \frac{1+1/x-109x}{(1+x)^2}$$

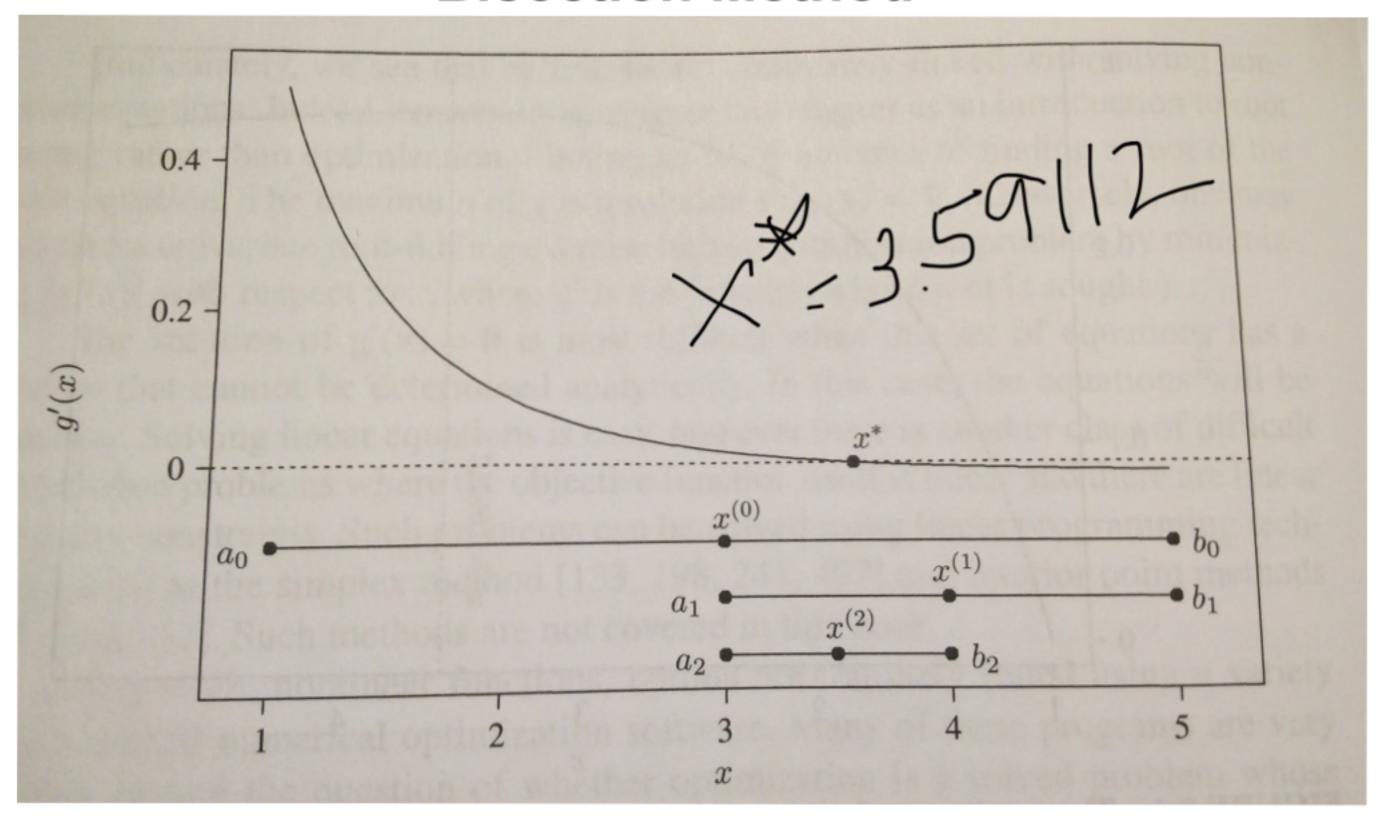

Bisection Method

If g'(x) is continuous on $[a_0, b_0]$ and g'(a_0) g'(b_0) ≤ 0 , then by IVT there exists and x^* in $[a_0, b_0]$ such that g'(x^*)=0 and is a local optimum.
